APPLY WISE

AI Job Application Copilot

Product status and delivery roadmap

Updated June 15, 2026 | Live: https://apply-wise-1.vercel.app

What is live

Apply Wise is a deployed web product for resume-aware job discovery, truthful application preparation, and pipeline tracking. Users can register publicly and maintain private workspaces.

Live architecture

Layer	Technology	Current role
Web app	Next.js 15 / Vercel	Responsive SaaS interface
API	FastAPI / Railway	Authenticated application API
Database	PostgreSQL / Alembic	Persistent product records
Job source	Adzuna + Remotive APIs	Live India and remote listings with attribution
Security	JWT + refresh rotation	Protected user workspaces

Implemented workflow

- Register, log in, log out, and refresh an authenticated session.
- Upload a PDF or DOCX master resume and review extracted skills, experience, education, and certifications.
- Search live Adzuna and Remotive listings and rank jobs against stored resume skills.
- Save roles, update statuses, and monitor dashboard and analytics metrics.
- Prepare Gemini-enhanced grounded drafts with deterministic fallback.
- Set role keywords, location, and remote-only discovery preferences.
- Add application notes and review visible tracker timeline events.
- Schedule interview rounds inside the application workspace.
- Download authenticated DOCX or PDF exports for prepared resume versions.
- Review persisted free-tier or owner-bypass subscription entitlements.
- Review non-secret health for the configured job-source aggregator.
- Reschedule interviews, edit preparation notes, or remove obsolete rounds.
- Paste a career-page role, score it, and save it into the tracker.
- Pair an unpacked Chrome extension and review job pages before scoring.
- Review ATS-readiness breakdowns and approve or dismiss roles in the 80+ queue.
- Review duplicate protection and draft readiness before opening the employer page for manual submission.
- Inspect common employer application fields locally from the extension and fill only user-approved fields.
- Capture cleaner Greenhouse, Lever, LinkedIn, Indeed, Naukri, Workday, Ashby, SmartRecruiters, and common career pages.
- Discover remote roles through the Remotive provider with short-lived API caching and visible attribution.
- Search by role and location directly from the Jobs page while still falling back to saved preferences.
- Follow a guided application workflow for approve, prepare, download, employer-page review, and applied-date tracking.
- Download persisted cover letters as authenticated TXT files after preparation.

- Open the exact saved application workflow directly from a job recommendation.
- Filter job recommendations by high-fit score, provider source, and remote-only roles.
- Review recommendation explanations for matched skills, ATS readiness, missing skills, and seniority fit.
- Edit and save prepared cover letters before downloading or applying.
- Edit tailored resume summary, skills, and experience text before DOCX/PDF download.
- Review extension capture readiness and re-extract the current page before sending a job.
- Request and confirm password resets with one-time tokens in local/test environments, revoke sessions after reset, and show a production support recovery path until automated reset email delivery is added.
- Review owner-only admin summary metrics for users, jobs, applications, generated materials, and subscriptions.
- Download tailored resumes from the extension for manual attachment on employer forms with manual-upload-required status.
- Review dry-run automation capability flags and manual-submit plans for LinkedIn, Naukri, Indeed, Workday, Greenhouse, Lever, Ashby, SmartRecruiters, Jobvite, iCIMS, BambooHR, Workable, and generic career pages.
- Retry transient AI generation failures with configurable backoff and visible fallback metadata.
- Use a consolidated Review Application panel with job details, match/ATS scores, tailored resume version, cover letter preview, required fields, missing information, warnings, manual review confirmation, and manual-submit guardrails.
- Flag unsupported generated skills, companies, titles, and metrics against the master resume before applying.
- Retry transient job-provider failures with configurable backoff and visible sanitized provider health.
- Require explicit confirmation before downloading resumes with unresolved unsupported-claim warnings.
- Retry resume export generation and record export download attempts in the application timeline.
- Start tracked assisted-application dry-run records with blocked/ready status, warnings, next actions, and audit events.
- Queue material-preparation runs with visible status, attempts, results, failed-run retry controls, and timeline events.
- Present compliance-focused public pages with INR pricing, Razorpay trust text, digital delivery terms, refund rules, support details, FAQ, and third-party disclaimers.
- Confirm manual application review before assisted application actions and record the confirmation in the activity timeline.
- Map common autofill fields for profile, links, education, experience, skills, cover letter, and resume file assistance.
- Log extension autofill approval and resume upload failed/manual-required events in the activity timeline.
- Record explicit audit events for tailored resume generation, cover letter generation, and application marked applied.
- Show clearer extension recovery messages when a pairing token expires.
- Gate extension autofill plans behind Review Application confirmation so assisted filling cannot start before manual review.
- Detect common data-attribute field labels and include manual-only review coverage for work authorization and pronouns.
- Use explicit Jobvite, iCIMS, BambooHR, and Workable adapters for common employer career pages.
- Score ATS keywords from provider skills or fallback job-description terms when structured provider data is sparse.
- Harden extension autofill by skipping disabled, read-only, hidden, empty-value, checkbox, and radio controls and matching select options conservatively.
- Show a dashboard activity log for resume upload/parsing, job scoring, and captured-job audit events.
- Show Settings privacy guidance with a support path for account and data deletion requests.
- Allow the extension popup to save a configurable Apply Wise API URL for backend domain changes.
- Scope extension host permissions to Railway subdomains for backend URL changes.
- Provide an authenticated account data export from Settings without password hashes, tokens, or payment credentials.
- Separate active and archived application views so rejected or withdrawn roles stop cluttering the working pipeline without deleting history.
- Guide users from parsed resume to job matches, saved roles, and Review Application on the Resume page.
- Show account data export events clearly in the dashboard activity timeline.
- Guide users on the Jobs page when they need to upload a resume, broaden search, or paste a job manually.
- Use editable application profile fields from Settings to improve Review Application and extension autofill mapping.

- Clean Applications page review/material labels to avoid separator encoding artifacts in production UI.
- Clean extension autofill preview labels and bump the unpacked extension version for reload clarity.
- Show a dashboard launch checklist backed by resume, profile, match, application, preparation, and review readiness.
- Require explicit confirmation before marking an application as applied to reinforce manual final submission.
- Enforce manual-submission confirmation on the API before accepting an applied status.
- Replace visible compliance-page business placeholders with founder, location, and support details for payment review readiness.
- Mark QA/STAGE promotion documentation as paused while MVP work ships directly to prod.
- Validate application-profile URLs server-side before using them for review and autofill mapping.
- Surface API validation details in Settings when application-profile fields cannot be saved.
- Record extension form-inspection and autofill execution failures in the application timeline with manual fallback guidance.
- Improve extension field detection with ARIA-linked labels, nearby question text, and common employer-form data attributes.
- Validate extension syntax and popup element contract in CI alongside backend and web checks.
- Fix LinkedIn extraction with scoped job-detail selectors, direct/recommended URL support, selector diagnostics, noisy-description blocking, and no linkedin.com company fallback.
- Harden LinkedIn extraction after real browser regression with dynamic content wait/retry, real-DOM diagnostics, focused candidate-container text fallback, document-title parsing, and selector-count reporting.
- Add LinkedIn visible job-card fallback for company-above-title layouts plus body text length/first-1000 diagnostics and PrismHR regression coverage.
- Verify extension capture flow in automated tests from LinkedIn payload submission through saved application persistence, ATS/match scoring, tailored resume generation, cover letter generation, and audit events.
- Add extraction regression coverage for LinkedIn, Naukri, Workday, one generic company career page, and noisy/missing-field validation.
- Generate stored tailored resumes and cover letters directly from captured jobs on the Jobs page with previews, copy/download actions, ATS suggestions, and model metadata.
- Keep persisted manual and extension-captured jobs visible on the Jobs page after refresh by appending stored scored jobs to fresh provider search results.
- Verify production API health, database readiness, Gemini-enabled generation, migration-applied generation metadata, authenticated downloads, owner-scoped access, and extension-token capture with a throwaway live smoke test.
- Confirm post-deployment on Railway that captured jobs remain visible from the Jobs page after refresh with saved state and application ID preserved.

Truthfulness rule

Application drafts use stored resume evidence only. They do not invent employers, skills, projects, responsibilities, or achievements. Every draft remains review-required.

Security and operations

- Argon2id password hashing and HTTP-only refresh cookies.
- Refresh-token rotation with replay detection and token-family revocation.
- Logged-in password changes verify the current password and revoke existing refresh sessions.
- Owner admin allowlist configured through Railway environment variables.
- Production secrets stored in Railway variables, not committed to Git.
- Railway health and PostgreSQL readiness probes.
- Schema changes managed with Alembic migrations.

Current limitations

- Adzuna and Remotive are connected; deeper direct company-career-page provider integrations remain future work.
- Resume parsing is deterministic and requires user review.
- Gemini enhancement depends on API quota; grounded fallback drafts remain available.
- Payment checkout, webhooks, and paid-plan activation are not connected.
- Assisted autofill is review-gated behind Review Application confirmation; direct file upload and real Playwright browser control remain future work.

Next delivery slices

Order	Slice	Outcome
1	Reliability hardening	Continue retries, graceful failures, and safety controls for assisted actions
2	Site-specific selectors	Add more employer-site-specific field selectors as real users report gaps
3	Extension UX	Polish extension flows after live usage feedback

Repository practice

README.md, docs/PRODUCT_STATUS.md, and this PDF snapshot are updated as product slices ship. During the current MVP push, changes go directly to prod after local validation. Secrets remain outside the repository.
